Silver Point - Peecho Production Workflow Manual

Facility Partner: Silver Point Print-on-Demand (UAE / India) • **Client:** Peecho B.V. • **Scope:** Shopfloor Operations & Status Tracking

1. Environment Overview

Incoming Peecho print orders are routed through dedicated Production and Staging endpoints to ensure test orders remain strictly isolated from active physical press runs and billing.

Environment	Inbound Order Endpoint URL	Shopfloor Handling & Tagging
Live Production	`https://orderflow.silverpointprint.com/api/v1/peecho/webhook/`	Tagged `is_sandbox = False`. Routed directly to live Prepress & Press queues.
Staging Sandbox	`https://staging.orderflow.silverpointprint.com/api/v1/peecho/webhook/`	Tagged `is_sandbox = True` (`TEST ORDER`). Isolated from physical press queues & invoicing.

2. 5-Step Shopfloor Workflow

Step	Workstation & Operational Procedure	Status Transition

STEP 1	**Order Ingestion**
	Automatic order intake from Peecho with customer delivery details, book specifications, and print quantities. Orders arriving via the Staging endpoint are automatically flagged with `is_sandbox = True` (`TEST ORDER`).
		`RECEIVED`
		or
		`TEST_ORDER`

STEP 2	**Prepress Inspection**
	Prepress specialists retrieve interior content and cover wrap PDF artwork files from storage and verify print resolution (300 DPI), page count, spine width, trim box, and 3mm bleed margins.
		`PREPRESS_QUEUED`
		↓
		`PREPRESS_PASSED`

STEP 3	**Imposition & Job Tickets**
	Verified orders are batched together by paper stock (GSM), trim size format, and binding type. The system generates a printable **QR Code Job Ticket** that travels physically with the work tray across the shopfloor.
		`BATCHED`
		↓
		`QUEUED`

STEP 4	**Press Station Camera Scanning** Operators scan the QR Job Ticket using a mobile phone camera or handheld scanner at each physical workstation to record real-time progress across Press, Guillotine, Bindery, and Quality Control.	`Queued → Printing → Cutting → Binding → QC Passed`

STEP 5	**Barcode Dispatch**
	Packing staff scan the courier AWB waybill barcode, attach the shipping label, and hand off the parcel to the carrier. The scan automatically triggers the live shipment tracking update back to Peecho.
		`READY_FOR_DISPATCH`
		↓
		`DISPATCHED`

3. SLA & Re-Print Policies

Policy Area	Commitment & Target Window	Shopfloor Standard Operating Procedure (SOP)
Turnaround SLA	**24 to 48 Hours** (Standard) **8 Hours** (Rush Priority)	All live production orders (`is_sandbox = False`) are completed through Prepress, Printing, Binding, QC, and Courier Dispatch within 24 to 48 hours of order ingestion.
Damaged / Rejected Re-Print Procedure	**Immediate Re-Queue** (`RUSH_8H` Priority)	1. Operator flags the defect at Cutting, Binding, or QC station (e.g., streaking, trim bleed error, casing scuff). 2. System logs the damaged sheet count and reason code. 3. Order is automatically re-queued to Prepress/Press with elevated `RUSH_8H` priority and a replacement QR Job Ticket.
Staging / Sandbox Policy	**Isolated Testing** (`is_sandbox = True`)	Orders received via the Staging URL are labeled `TEST ORDER` on the dashboard and excluded from physical press queues and Statements of Account unless explicitly authorized for a press test run.
