Silver Point - Peecho Integration & Workflow Guide

Partner: Silver Point Print-on-Demand (UAE / India) | Client: Peecho B.V. | Fulfillment SLA: 24–48 Hours

1. Architecture & Single-Domain Endpoint Routing

Platform: Django REST Framework & Next.js (Single-Domain Architecture). Both Live Production and Staging Sandbox orders use the same HTTPS webhook URL and are automatically routed by their secret key in **X-Peecho-Signature**:

Environment	Webhook Endpoint URL	Secret Key & Routing Behavior
Production (Live)	`https://orderflow.silverpointprint.com/api/v1/peecho/webhook/`	Signed with **PEECHO_PRODUCTION_SECRET_KEY**. Sets **is_sandbox = False** (live press & billing).
Staging (Sandbox)	`https://orderflow.silverpointprint.com/api/v1/peecho/webhook/`	Signed with **PEECHO_STAGING_SECRET_KEY**. Automatically flags **is_sandbox = True** (status **TEST_ORDER**).

2. Simple Workflow Overview (5 Steps)

- **Step 1 — Ingestion:** Peecho sends orders via the Webhook URL. Payloads authenticated with **PEECHO_STAGING_SECRET_KEY** are automatically tagged with **is_sandbox = True**, isolating them from live shopfloor queues and billing.
- **Step 2 — Prepress:** Interior and cover PDFs are retrieved from storage and verified for print resolution (300 DPI), bleed, and spine width.
- **Step 3 — Batching & Job Tickets:** Approved live orders are grouped by GSM paper stock and size format with printable QR Code Job Tickets.
- **Step 4 — Shopfloor Printing:** Mobile camera/scanner scans the QR Job Ticket to transition status: **Printing** → **Binding** → **QC**.
- **Step 5 — Dispatch & Callback:** Courier AWB barcode scan triggers an automatic tracking callback back to Peecho.

3. API Integration Specifications

Direction	Endpoint	Purpose & Authentication
Inbound Webhook (Peecho → Silver Point)	`POST /api/v1/peecho/webhook/`	Receives customer order payload, shipping address, and PDF links. Validated via **X-Peecho-Signature** (HMAC-SHA256) using Production or Staging key.
Outbound Callback (Silver Point → Peecho)	`POST /v2/orders/{id}/shipment`	Pushes tracking code, carrier name, dispatch timestamp, and tracking URL back to Peecho upon AWB scan.
